Antibiotic overuse breeds treatment resistance

A tool to address this.

An intelligent interface project targeted towards educating people of different ages about when and why to use antibiotic medication.

This will be done by educating users through the use of a simple to use chat-bot which will answer varied questions relating to antibiotics and its use.

Problem Definition

According to the **World Health Organisation** [1]: "Antimicrobials - including antibiotics, antivirals, antifungals and antiparasitics - are medicines used to prevent and treat infections in humans, animals and plants."

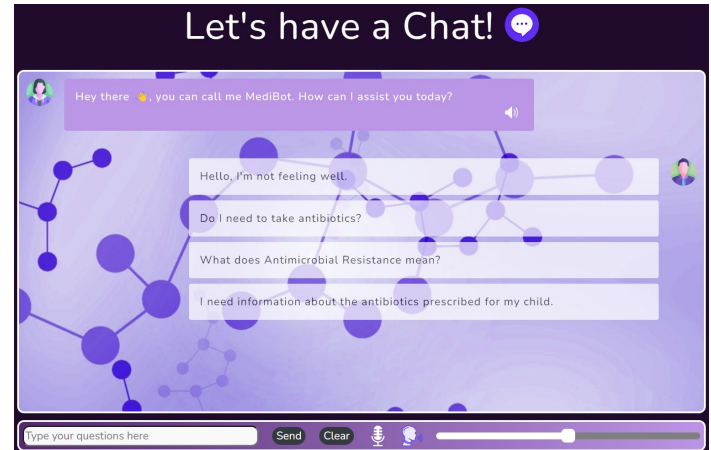

Excessive antibiotic use leads to heightened drug resistance, impacting treatment efficacy and complicating infection management, posing severe health risks.

Antimicrobial Resistance (AMR) generates drug-resistant organisms globally, limiting treatment options, inflating healthcare costs, and elevating risks during medical procedures, necessitating urgent prevention and treatment strategies.

Proposed Solution

Antibio Advisor, a web app tailored for individuals 18 or older but available for all. Our web app offers an array of vital features: an intelligent chatbot for medical guidance, an interactive map to locate pharmacies and general practitioners, and a comprehensive term guide.

Prioritising user awareness, our platform provides essential information in the form of a FAQs page, an informative Quiz and a prescription info page.

Frequently Asked Questions

Sort by Age

General

Q: *Can I give antibiotics to my pets?*

Q: *Are there natural alternatives to antibiotics?*

A: "There are some natural remedies, but they may not be as effective as antibiotics for bacterial infections. Consult with a healthcare provider for the best treatment options."

Q: *Can I take expired antibiotics?*

Q: *What should I do if I miss a dose of antibiotics?*

Decipher your Prescription

Select an Antibiotic

In this section, learn more about your prescription by selecting the appropriate antibiotic, abbreviation and notation from the dropdowns. If something is missing from the dropdowns below, please contact us so we can add it to the list, furthermore feel free to discuss it with the chatbot.

0-1-0

1-0-1

Explanation:

Penicillin is one of the first antibiotics discovered by Alexander Fleming in 1928. It's effective against a wide range of bacteria and has been used to treat various infections, including strep throat and syphilis.

PRN: Abbreviation for 'pro re nata', or 'as needed'.

1-0-1: One pill in the morning, skip midday, and one pill in the evening.

Test your Antibiotic Knowledge

The **Quiz** page, offers insights into antibiotics and antimicrobial resistance.

Four **randomly** selected questions retrieved from a json file are presented to the user. The answers are randomly **shuffled** to increase test variety and gauge user knowledge and expertise, whilst advocating for responsible healthcare practices.

Users are also given the ability to **generate** new questions.

Question 1 - Can antibiotics be used to treat fungal or yeast infections?

A: Using antibiotics for fungal infections is recommended

B: Antibiotics can cure fungal infections faster

C: Antibiotics are effective against fungi, Antibiotics treat both bacteria and fungi

D: Antibiotics work best for yeast infections

E: No, antibiotics target bacteria, not fungi

 Correct!

Question 2 - What's the most common side effect of antibiotics?

A: Upset stomach and diarrhea

B: Stronger bones and healthier hair

C: Improved digestion, Stronger immune system

D: Enhanced taste and smell

E: Clear skin and increased energy

 Incorrect! The Correct answer was: Upset stomach and diarrhea
